Cardiovascular drugs: quick reference

Use this table with Lecture 9. Half-lives are typical adult values and vary with renal function.

Drug	Class	Mechanism	Half-life (h)
Metoprolol	Beta blocker	Blocks beta-1 receptors	3-7
Lisinopril	ACE inhibitor	Blocks angiotensin II formation	12
Amlodipine	Calcium channel blocker	Blocks L-type calcium channels	30-50
Furosemide	Loop diuretic	Inhibits NKCC2 in the loop of Henle	2
Digoxin	Cardiac glycoside	Inhibits Na+/K+ ATPase	36-48
Warfarin	Anticoagulant	Inhibits vitamin K epoxide reductase	40

Digoxin has a narrow therapeutic index; check levels if renal function declines.
